

XSS Reflected

DVWA

Procedure:

Reflected XSS attacks, also known as non-persistent attacks, occur when a malicious script is reflected off of a web application to the victim's browser.

1. Inject the code `<script>alert (document. Cookie) </script>` and click submit button.

The XSS reflected vulnerability is almost identical to XSS stored vulnerability, except it just reflects the output. This vulnerability usually occurs because the user input validation doesn't take place

2. A pop-up message will appear, then you will try to submit some names, and you will get the entered input.
